**Reliable analytical procedures for biomonitoring** of chemical exposure at the workplace by the DFG Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area

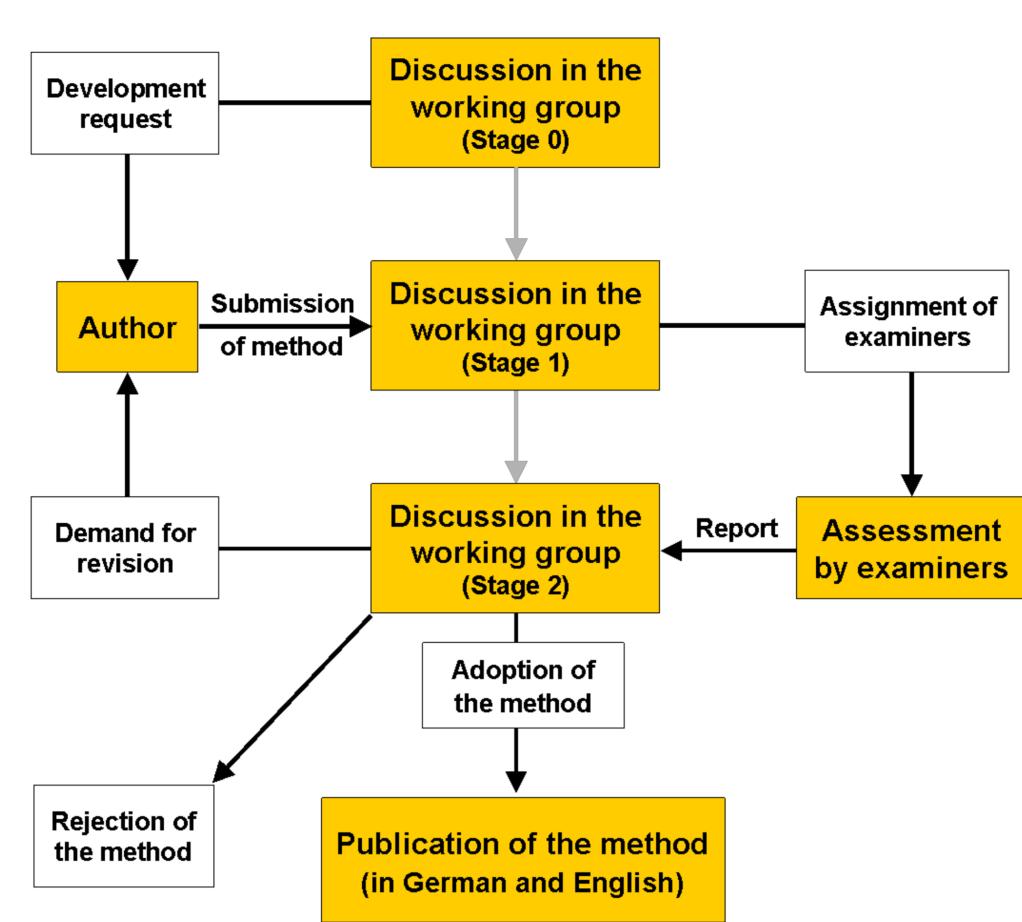

Thomas Göen, Elisabeth Eckert, Anja Schäferhenrich, Lukas Schmid

**LONDON 2015** 

**10<sup>th</sup> IOHA** International **Scientific Conference** London, 25-30 April 2015

# **Objectives**

The Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area was founded by the Deutsche Forschungsgemeinschaft (DFG) in 1955. The Commission advises the German government and its agencies concerning the estimation of health risks by chemical exposure and their prevention. Within the commission, the working group "Analyses of Hazardous Substances in Biological Materials" (AiBM) develops and verifies procedures for the determination of chemical substances in biological materials.

#### Results

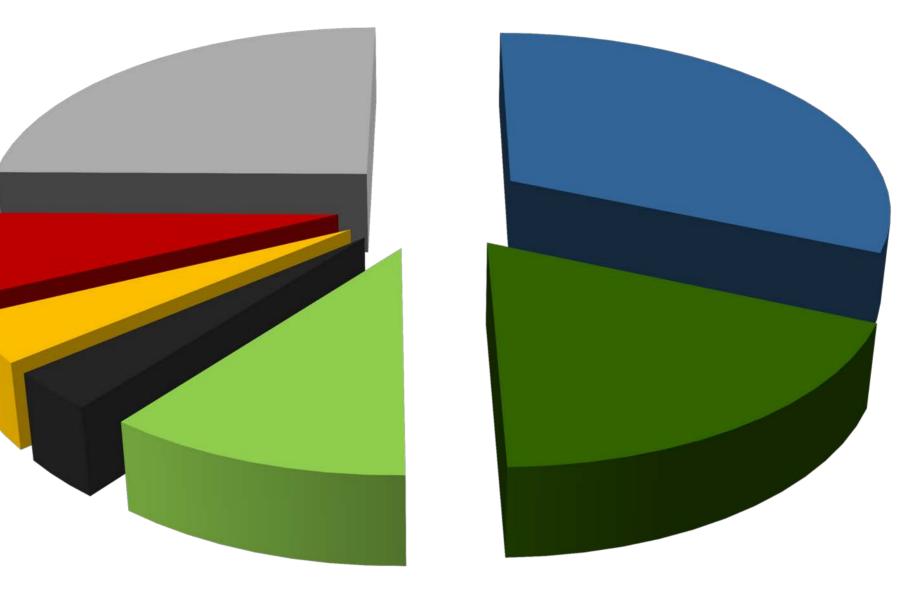

Since 1985 the working group published 149 analytical methods in 13 issues of the English edition. These procedures refer to the analyses of different agents or effects in human biological materials: metals, solvents, pesticides, markers of susceptibility, biomarker of combustion products and tobacco smoke, biological effect markers, and further occupationally used chemicals (Fig. 2). The analytical techniques used for these methods are mainly GC and HPLC procedures for organic compounds and/as well as AAS and ICP for inorganic parameters (Fig. 3). A lot of the methods enable the determination of the environmental exposure, too. The documentations of the procedures are detailed and provide ready-to-use protocols and contain all reliability data verified in the examination process.

## **Resources and Processing**

The AiBM working group consists of experts who possess the necessary/required experience in biomonitoring validating performing and procedures and are in a position to reproduce and examine external procedures in their own laboratories. Recently, 34 experts from Germany and abroad take active part in the working group.

Figure 1 shows the scheme of the submission and examination process in the AibBM working group. Generally, a member of the working group or an external expert ('author') submits a human biomonitoring method to the group. Moreover, in some cases a member of the group is asked to develop a method for a HBM parameter which is missing in the method collection of the working group (Stage 0). After a first discussion on the submitted method the AiBM group selects at least one examiner (Stage 1), who tries to reproduce the method in her/his laboratory and to verify the reliability criteria. The report given by the examiner is discussed within the group (Stage 2). The method may be adopted for publication or may be given back/returned to the author with demand for revision. Again, the results of the revision are reviewed and reported by the examiner. In case of fundamental drawbacks the method is rejected. At least the following reliability criteria have to be tested and documented by authors and examiners:

Solvents (27)

Combustion products (5)

Genotype/Phenotype (10)

Since January 2012 all publications of the DFG Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area (The MAK-Collection for Occupational Health and Safety) are available in open access.

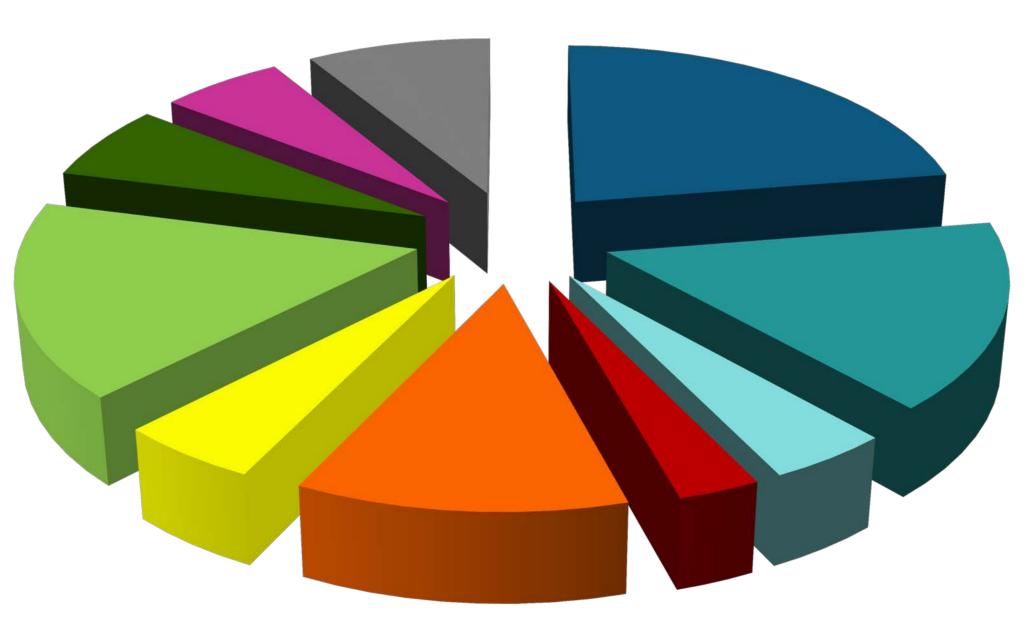

## Conclusions

AiBM working The promotes group the development and publication of biomonitoring methods for the determination of occupational and environmental chemical exposure.

- Sensitivity: demonstrated by the limit of detection (LOD) and the limit of quantification (LOQ)
- Repeatability: contains data for within-day precision and precision from day to day.
- Accuracy: information on relative and absolute

Metals (47) Pesticides (16) Effect parameters (6) other (37)

Fig. 2: Groups of parameters determined by the biomonitoring methods of the MAK-Collection (number in brackets).

The crucial benefit of this work is the supply of unambiguously composed procedures with proven reliability.

## Acknowledgment

The activity of the working group is supported by the Deutsche Forschungsgemeinschaft. The Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area is indebted to all members and external experts of the AiBM working group for their contribution to the tasks of the commission.
